Electronic circuit for driving a field effect transistor comprising:

a field-effect transistor (T1) having a source section (2), a drain section (3) and a gate section (5), and driving means (T2, T3) for driving said field-effect transistor (T1), said driving means (T2, T3) being able to drive said field-effect transistor (T1) such that an electrically conductive channel between said source section (2) and said drain section (3) is formed and/or maintained, characterized in that said field-effect transistor (T1) has an electrically conductive gate covering element (7) having a thin insulation layer (8) which entirely or partially encloses the regions of said gate section (5) which do not face said electrically conductive channel,

said gate covering element (7) being electrically connected to said source section (2) or to said drain section (3), and in that

when a voltage is to be passed from said source section (2) to said drain section (3), the application of which source section (2) would result in that no electrically conducting channel is formed or in that an existing electrically conducting channel breaks down, said driving means (T2, T3) drive said field-effect transistor

(T1) such that

a gate voltage is applied to said gate section (5), which causes the formation and/or maintenance of an electrically conductive channel between said source section (2) and said drain section (3),

after said electrically conductive channel has been formed, said gate section (5) is disconnected from a gate voltage supply source which applies a gate voltage to said gate section (5) said disconnection causing that said gate section is floating and said electrically conductive channel is maintained thereafter, and

after disconnecting said gate section (5) from said gate voltage supply source said source voltage value is changed to the value of the voltage to be passed from said source section (2) to said drain section (3).
